Timezone Companion: AI eval report

Run on Sat 17 Oct 2026 against the live model. Every row sends the model a fixed "now" on a working day, so the real date of the run does not matter.

Summary

Model	`gpt-6-luna`, reasoning effort `none`, OpenAI Responses API with strict JSON schema
Test set	93 messages: 72 short, 21 long; 79 English, 14 Arabic
Runs	3 full runs, 279 calls
Accuracy	**89, 84, 85 of 93** (95.7 %, 90.3 %, 91.4 %); pass bar 84 of 93 (90 %) met in every run
Critical errors	**0** in 279 calls (an exact time invented where there is none)
Accuracy without timeouts	258 of 270 answered calls (95.6 %)
Timeouts	9 of 279 calls (3.2 %) hit the 12 s limit; the app shows "try again"
Latency per call	median **1.5 s**, mean 3.0 s, p95 10.3 s (answered calls, 10 in parallel)
Tokens per call	~2,970 in (97 % from the prompt cache), ~58 out

Pass rule: a row is right only when every field of every time matches (kind, date, time, end time, zone, zone reason, flag), and the number of items matches. A row with a timeout counts as wrong.

Results per run

Run	Started (UTC)	Right	Critical	Timeouts	Median	Mean	p95	Max
1	10:37	89 / 93	0	1	1.62 s	3.00 s	10.1 s	11.6 s
2	10:39	84 / 93	0	4	1.48 s	2.84 s	10.1 s	10.6 s
3	10:40	85 / 93	0	4	1.42 s	3.11 s	10.5 s	11.2 s

Latencies are for answered calls only; a timeout is 12 s by definition.

Results per group (3 runs together)

Group	Calls	Right	Accuracy	Timeouts	Median	Mean	p95	Sent chars (mean)
All	279	258	92.5 %	9	1.54 s	2.98 s	10.3 s	42
Short	216	200	92.6 %	7	1.54 s	3.16 s	10.5 s	26
Long	63	58	92.1 %	2	1.54 s	2.38 s	8.9 s	98 (of 161 written)
English	237	221	93.2 %	8	1.52 s	2.84 s	10.1 s	44
Arabic	42	37	88.1 %	1	1.71 s	3.81 s	10.5 s	29

Long messages go through `excerpt` first: only sentences with a time hint and one sentence on each side reach the model. On average the model saw 98 of 161 characters.

By expected kind

Expected	Calls	Right
Exact time	174	158
Range	15	15
Ambiguous (zone, am/pm or day unclear)	15	14
Vague (part of day only)	21	21
No time at all	39	39
Two or more times in one message	15	11

What the test set covers

- **Clock forms:** 3pm, 15:30, 9:30, noon, midnight, half past three, quarter to ten, three o'clock, ten thirty, eleven-fifteen, two forty-five, ten oh five, 1500, 0930hrs, 1500Z.
- **Zones:** city names (Doha, Muscat, London, Delhi, Tunis, Baghdad, Ho Chi Minh City), "my time", "your time", AST, GST, IST, GMT, CET, ET, Z, CST (unclear on purpose).
- **Days:** today, tonight, tomorrow, weekday names, "next Thursday", "Monday 26th", "the 20th", a day stated in the neighbouring sentence, and a day that belongs to a different event.
- **"Now" on different weekdays:** Tuesday for most rows; Gulf Thursday and Sunday (Sunday is a workday there), European Friday and Monday, to check "tomorrow", "next Monday" and "Monday" from a Monday.
- **Arabic:** Arabic-Indic digits, صباحًا / مساءً, بكرة, بتوقيت الدوحة, العصر, الصبح, بعد المغرب, ثلاث ونص, اربع وربع, ثمانية.
- **Not times (must return nothing):** EOD, durations, versions, prices (10.30 QAR, 1500 QAR), counts, ratios, ticket and room numbers, "ten people", greetings and sign-offs.
- **Safety:** a message that tells the model to ignore its rules and invent a time.

Failures

#	Message	Fails	Expected	Got	Type
10	Ping me at 9pm IST if the build fails	3 / 3	21:00 Asia/Kolkata	zone unclear	Model ignores the IST rule (team has Delhi, no Dublin or Jerusalem)
36	Ops review ١٥:٠٠ GST	3 / 3	15:00 Asia/Muscat	nothing, or no time	Arabic-Indic 4-digit time; the Latin "1500 GST" passes
93	(long) … The sync is at ten thirty tomorrow …	3 / 3	10:30, no flag	10:30 with "am/pm assumed"	Right time and zone, a needless am/pm flag
30	Let's sync at three o'clock Doha time	2 / 3	15:00	03:00	Wrong am/pm for an hour in words; seen on 13 Oct too
51	بكرة الساعة ثمانية	1 / 3	ambiguous, no time	ambiguous, 08:00	Right kind and flag; time should be empty for 7 or 8
2, 15, 26 ×2, 27, 32, 63, 85, 90	various	9 calls		timeout after 12 s	Model did not answer in time

None of the failures shows a wrong exact time to a reader on a message with no time. Rows 10 and 36 show "zone unclear" or nothing, which the UI treats as "check the time yourself". Row 30 is the only wrong time a reader would see.

Latency

- The model's own processing time (`openai-processing-ms`) is most of the total: median 1.24 s of 1.54 s.
- **62 of 279 calls (22 %) took over 5 s, and almost all of that was model time**, not network. On 13 Oct, with 30 calls in parallel, no call took over 3.2 s. The slow tail on 17 Oct is the provider's, and could be weekend load or the burst of 10 calls; it needs another run on a workday to tell.
- Long messages are not slower than short ones: the prompt and the 14-day calendar are about 2,900 tokens, the message adds little.

Cost

Per call about 2,970 input tokens, of which about 2,875 come from the prompt cache, and about 58 output tokens. Reasoning tokens: 0 (effort `none`). Multiply by the current price of `gpt-6-luna` for a cost per message; the cache share makes the prompt nearly free after the first call.

Pre-filter (TIME_HINT)

The browser runs a regex before it calls the AI. Of the 93 messages, 7 do not pass it, and all 7 are messages with no time (EOD, 2h, 1500 units, 1500 QAR, ticket 21500, ten people, room 1430). So no message with a time was stopped, and these 7 never cost an AI call in the app. The eval calls the API directly, so these rows still test the model.

Ideas from this run

- Arabic-Indic 4-digit times ("١٥٠٠ GST"): add one prompt example, or normalise digits in code before the call.
- IST: the rule is clear but the model skips it; a prompt example with IST would likely fix it.
- Hours in words with "o'clock": a sanitize rule could apply the same am/pm rule as for digits.
- "ambiguous" with flag `ampm_unclear`: sanitize can clear `localTime` mechanically.
- Timeouts: one retry on timeout, or a 15 s limit, would turn most of the 3 % into right answers; the cost is a longer wait in the worst case.

Method

- Code: `src/lib/parseTime.eval.test.ts`, run with `npm run eval` (vitest, `--mode eval`, key from `.env.local`). The test calls `extract` from `api/parse-time.ts`, the same function production uses, with the same prompt, schema and `sanitize`.
- Team zones in every call: Prague, London, Tunis, Doha, Muscat, Baghdad, New Delhi.
- Each row: message, sender zone, "now" (ISO with offset), expected items. Long rows must be at most 500 characters and must be cut by `excerpt`.
- Calls run 10 at a time, so latencies are under a small burst, not one call at a time.
- Client timeout 12 s, no retries, `max_output_tokens` 800, `store: false`.
- Raw results: `eval-results.csv`, one row per call (279 rows), with the message, what was sent to the AI, the expected and returned items as text and as JSON, right / critical, error and timings. Each result holds the message, the excerpt sent, the pre-filter result, sender zone, now, expected and returned items, right / critical, error, total ms, model ms and token usage.

All 93 messages

✓ right, ✗ wrong (what the AI returned), ⏱ timeout. Long messages are shortened here; the CSV has the full text and the exact JSON.
